Ⅰ　次の英文を読み、以下の問いに答えなさい。

A *honeycomb is the *structure of a bee's nest. It is made of many small *hexagons, which are six-sided shapes. Scientists and engineers study honeycombs because they can help people make strong and useful designs. Hexagons fit together perfectly without empty spaces. Circles cannot fit together without leaving gaps. This is why hexagons are special. They save space, do not waste anything, and use fewer materials to make products while staying strong.

Hexagons are also very strong. They can spread force *evenly in all directions. This means a honeycomb can hold heavy weight without breaking, even when something heavy is on top of it. At the same time, it uses fewer materials to make things than other shapes, which saves resources and lowers the cost. Engineers like this design because it is strong and useful and can be used in many different ways. Honeycomb structures show how nature can teach humans good ideas for making new things.

Honeycomb patterns are used in many things today. Airplanes use them in their wings to make the planes light and strong. Speakers sometimes have honeycomb parts inside to make the sound clearer. Furniture, like chairs and tables, can use this shape to be strong and to last a long time. Even soccer goal nets can have honeycomb patterns to be stronger and stay in good condition longer. This shows that learning ideas from nature can help people make things that are safe, strong, and useful. By studying honeycombs, humans can make better designs for many objects in daily life, putting together beauty, strength, and usefulness.

*注　honeycomb：ハチの巣（六角形の形で作られた構造）
structure：構造　　hexagon：六角形　　evenly：均等に

Q45　Why do hexagons fit well together?
1）They use a lot of material　2）They are round like circles　3）They are weak
4）They have six sides and leave no empty space　5）They are soft

Q46　Why is a honeycomb strong?
1）Because it is made of wood　2）Because it has circles　3）Because it is soft
4）Because it spreads pressure in many directions　5）Because it uses many colors

Q47　How do honeycomb structures save material?
1）They are very big　2）They use less material than other shapes
3）They are made of metal　4）They are empty inside　5）They are colorful

Q48　Which of these uses a honeycomb structure?
1）Cars only　2）Plastic bottles　3）Shoes　4）Airplane wings
5）Refrigerator

Q49　What does the text say about engineers?
1）They copy birds　2）They do not like nature
3）They use circles for all designs　4）They only build chairs
5）They like honeycomb designs because they are strong and efficient

Q50　What is the main idea of the text?
1）Circles are better than hexagons　2）Bees are dangerous insects
3）Nature teaches humans to make strong and efficient designs
4）Hexagons are difficult to make　5）Honeycombs are soft
